Chain transfer can occur in the presence of materials such as thiols, which are strong hydrogen donors. For LED systems, the single output line, like those of excimer lamps, offers limited formulation possibilities with no shorter wave UV for fast surface cure. There is some evidence to suggest that the latter is a more significant process.

Absorption at short wavelengths around nm is usually associated with excitation. Published on Dec View Download The semi-quinone radical produced from the photoreaction of 2-ethylanthraquinone, EAQ, and a hydrogen donor Figure 3.

The POs are used for thick film, highly pigmented formulations and are partic phosphinyl radicals that are produced are very sensitive to oxygen, which leads to poor surface cure when they are used alone, and POs are not suitable for thin film curing.
